

CLOCK IN — A SOLANA MOBILE HACKATHON

LAST MAN SKATING

Solana Mobile Edition

Proof of Play: earn SKR by skating, not gambling.

KRISTEN STUDIOS GAMES

Track: Clock In Hackathon

THE GAME TODAY

A live, organically-growing mobile game

An isometric skating battle royale built in HTML5 canvas, packaged natively for Android via Capacitor — already published and growing before this hackathon began.

2000+

organic installs
on Google Play

9

playable worlds
(lake, space, volcano, more)

Jul 12

in Production
on Google Play since

100%

PvP online duel & FFA
(no AI-farmed stats)

Porting a live game onto Solana Mobile

1

Native Mobile Wallet Adapter plugin

A Capacitor Kotlin plugin wired directly to MWA — no deep-links, Seed Vault / Seeker compatible, tested end-to-end on a physical Solana Mobile device with Phantom.

2

On-chain "Proof of Play" program

An Anchor program that opens a weekly pool, receives validated scores from a trusted backend, finalizes the pool, and lets players claim their share directly to their wallet.

3

Automated settlement backend

A Cloudflare Worker reads weekly Firebase stats, computes scores, and settles + opens the next pool on-chain every Monday — fully automated, with manual override always available.

HOW IT WORKS

From match to claimed SKR, every week

THE ECONOMIC MODEL

Proof of Play, not chance

No wagering. No randomness on the payout amount. The weekly pool is distributed purely by real competitive performance.

75%

SPLIT BY SCORE

Proportional to each player's weekly Duel + FFA wins.

25%

SHARED EQUALLY

Among every active player above a minimum score.

The stack, end to end

ON-CHAIN

- Anchor program — devnet
- 5 instructions: init, fund, submit, finalize, claim
- 8/8 unit tests passing
- u128 payout math, PDA-scoped anti-usurpation

BACKEND

- Cloudflare Worker
- Firebase RTDB — weekly score snapshots
- Weekly cron: settle + open next pool
- Manual override endpoint (protected)

MOBILE

- Capacitor + native Kotlin plugin for MWA
- Seed Vault / Seeker compatible
- HTML5 canvas game core (existing, unchanged)
- Claim flow signed via MWA / Phantom

VALIDATED, NOT JUST DEMOED

Tested end-to-end on a real device

Every critical instruction was run in conditions réelles — physical Android device, MWA-compatible wallet (Phantom), Solana devnet — not just Playground unit tests.

Wallet connect & authorize — Mobile Wallet Adapter

submit_score — confirmed on Solana Explorer

fund_pool — real weekly pool funded on-chain

claim_scratch — tokens received in player wallet

Double-claim correctly rejected (AlreadyClaimed)

Weekly cron — settlement + next pool auto-opened

Documented honestly, tackled next

Anti-collusion scoring

Score matches against a verified opponent-pair history instead of self-declared totals.

Mainnet SKR

Swap the devnet test token simulating SKR for the real mainnet mint.

On-chain claim deadline

Add an expiry + redistribution path for pools left unclaimed past the client's history window.

Split Play Store / dApp Store builds

Two dedicated AABs instead of one runtime-detection build.

Built solo. Shipped for real.

Last Man Skating is a live, published game — this hackathon added a real Solana Mobile economy on top of it, validated on-device, not just in theory.
